Amendments to the Specification

Please replace paragraph [0095] with the following amended paragraph:

[0095] The driving apparatus has a settlement portion 32 that is to be equipped with the treatment container 20. The settlement portion 32 has a driving roller 34 that revolve-drives the treatment container 20 in contact with the outer circumference of the treatment container 20. The settlement portion 32 is supported by a supporting base portion 36. As is shown in FIG. 1(a), the settlement portion 32 is furnished in such a manner that the settlement portion 32 can repeat a right-and-left to-and-fro motion while gyrating in the range of a definite angle to the supporting base portion 36 around a position of the furnishing to the supporting base portion 36, which position is under the central position in the axial directions of the treatment container 20. The treatment container 20 also carries out the same to-and-fro gyrating motion together with the settlement portion 32. As a result, the central axis, namely, the rotational axis C, of the treatment container 20 carries out the upward and downward or diametrically opposite rocking such that its one end becomes higher or lower than the other end.
